Introduction

This year I have decided to carry out my school internship, proposed by my school tutor, at Jam International. I was the one who suggested this company to my school because my brother works there and it is not very far from my house. My school accepted my proposal and I started this interesting and educational experience. I completed 120 hours of internship at Jam International during my fourth year of upper secondary school and 80 hours during my fifth year. Before starting, I examined and signed a specific training agreement in which I undertook to: observe the company rules, working hours, accident prevention regulations, privacy, and health and safety rules; follow my tutor's instructions; sign the attendance register daily; and promptly inform both the company and my school in case of absence.

Jam International

Jam International is located at 4 G. Perini Street, Ostra Vetere (AN), Italy. The company produces industrial sewing machines and sells them mainly in India, Bangladesh, and South America, with only a few sold in Italy. It is a medium-sized company with a friendly working environment and focuses on export and international trade. Here are some images of the machines it produces:

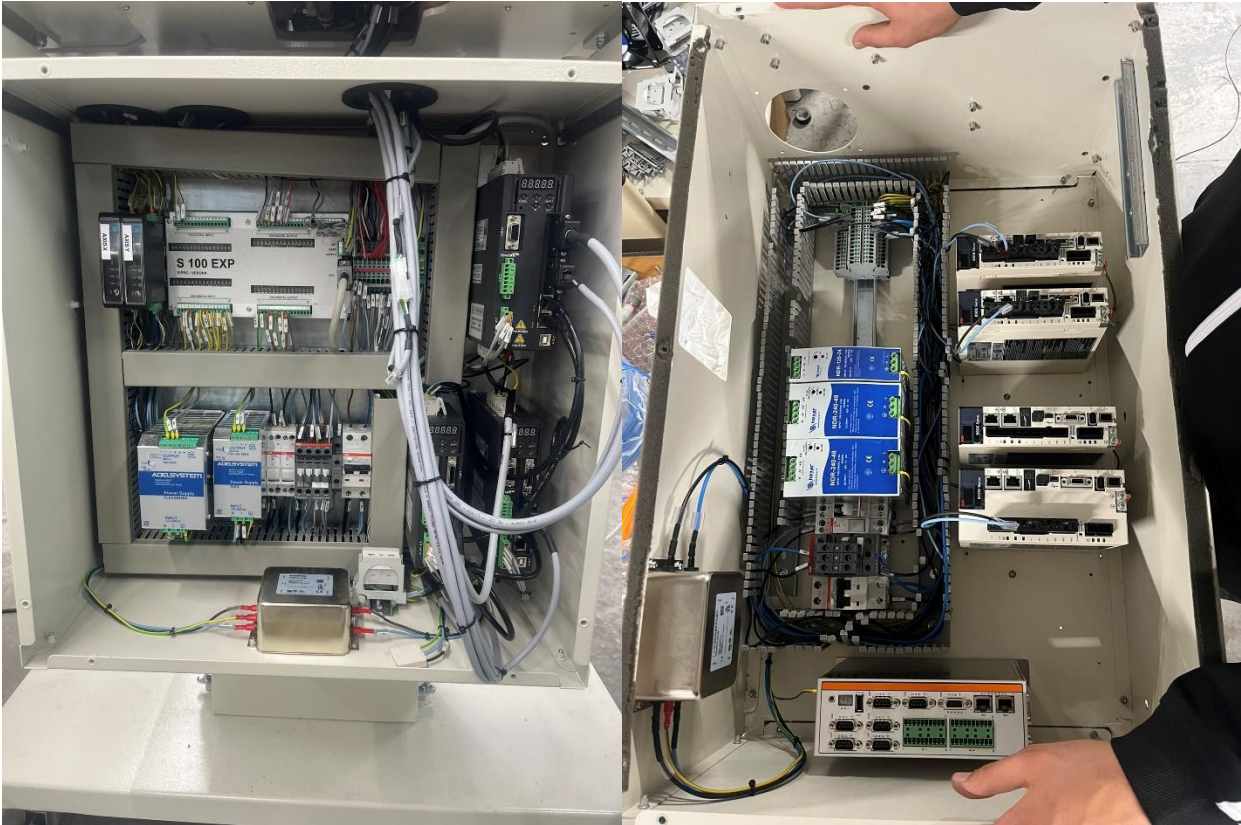

You can also watch some videos to see how the machines work. **[CLICK HERE!](#)**

Activities

During my internship at Jam International, I programmed electronic boards, created electronic cables, and assembled the cases where all the electrical connections for the sewing machines were placed. I also worked in the production area, helping with the machine heads and assembling parts, especially when production was behind schedule. In addition, I installed and programmed the electronic boards, tested them to make sure everything worked correctly, and soldered the cables when needed.

These are the cases where I connect the cables and drivers.

This image shows how we tested the drivers. Once the drivers were programmed with the PC, they were connected to motors and stayed connected for 30 minutes. During this time, they had to work correctly. If they stopped, we had to find the problem: sometimes it was in the program, other times the electronic boards were soldered incorrectly and we had to fix them. After the test, we recorded the temperature of the board.

Here I soldered a cable.

These are the machine heads. I put a big green tape under the head because later they paint the machines, and the part where I put the tape must not be painted. After placing the tape on the bottom part, I put the top part and assembled it. When everything was assembled, I put plugs in the holes to prevent the paint from getting inside.

Difficulties and Competences

During my internship, I faced some difficulties. The first difficulty was related to the length and distribution of my working hours. I worked every day from Monday to Friday, from 6 a.m. to 12:15 p.m., and in the afternoon from 2 p.m. to 5 p.m. Waking up very

early in the morning was hard, and at the end of the day, I was very tired. Sometimes I had little time to rest between the morning and afternoon shifts, and this made the days feel long and heavy. The second difficulty was the work itself. Some tasks were not very interesting for me, and sometimes I felt bored because they were not directly related to my school subjects. For example, assembling machine parts or soldering cables required attention and patience, but they were different from what I usually study. Despite this, I tried to take advantage of the situation. I used the opportunity to learn new things and improve my skills. I learned how to handle electronic boards, assemble machine parts, and follow safety rules in the company.

Apart from the difficulties I developed many skills and competences. I learned how to record the activities I carried out by following the correct procedures, identifying the problems I faced, and finding suitable solutions. I also learned to take on new and additional tasks when necessary and to collaborate with other members of the working team to achieve the company's objectives. I developed the ability to create good relationships with people working in different areas of the company by showing respect and appropriate behaviour. In addition, I applied the company's procedures and standards related to the work environment, quality, and safety.

Final Considerations

This experience helped me to acquire new theoretical and practical knowledge. I learned how to face new and unforeseen situations in which I had to show flexibility, and to adopt appropriate behaviours in compliance with current safety regulations. I also learned how to establish effective relationships with all the people involved in the company, colleagues, managers, customers, and suppliers, developing a sense of responsibility and autonomy. During the internship, I had the opportunity to understand how a real work environment is organized, including working hours, business rules, and professional relationships. I also gained knowledge about the labour market, which will help me make more conscious choices for my future career. Even though the tasks I performed were not directly related to my field of study, this internship allowed me to see the world of work closely. I really appreciated this experience because it helped me grow personally and professionally. It also made me realize which areas I can still work on to be better prepared for future opportunities.
